

Part IB — Methods Example Sheet 1

Supervised by Dr. Saxton
Examples worked through by Christopher Turnbull

Michaelmas 2017

QUESTION 1

$$\frac{f(x_+) + f(x_-)}{2} = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} \left[a_n \cos\left(\frac{n\pi x}{L}\right) + b_n \sin\left(\frac{n\pi x}{L}\right) \right]$$

For $f(x) = (x-1)^2$ on the interval $-1 \leq x \leq 1$, $f(x)$ is an even function, thus $b_n = 0$. We have $L = 1$, and

$$\begin{aligned} \frac{1}{2}a_0 &= \frac{1}{2L} \int_{-L}^L f(x) \, dx \\ &= \frac{1}{2} \int_{-1}^1 x^4 - 2x^2 + 1 \, dx \\ &= \int_0^1 x^4 - 2x^2 + 1 \, dx \\ &= \frac{8}{15} \end{aligned}$$

and

$$\begin{aligned} a_n &= \frac{1}{L} \int_{-1}^1 f(x) \cos\left(\frac{n\pi x}{L}\right) \, dx \\ &= \int_{-1}^1 x^4 \cos n\pi x \, dx - 2 \int_{-1}^1 x^2 \cos n\pi x \, dx + \int_{-1}^1 \cos n\pi x \, dx \end{aligned}$$

Evaluating each integral separately, we have:

(i)

$$\int_{-1}^1 \cos n\pi x \, dx = \left[\frac{\sin n\pi x}{n\pi} \right]_{-1}^{-1} = 0$$

as $\sin n\pi x = 0 \, \forall \, n$

(ii) By parts,

$$\begin{aligned} \int_{-1}^1 x^2 \cos n\pi x \, dx &= \left[\frac{x^2 \sin n\pi x}{n\pi} - \frac{1}{n\pi} \int 2x \sin n\pi x \, dx \right]_{-1}^1 \\ &= -\frac{2}{n\pi} \int_{-1}^1 x \sin n\pi x \, dx \end{aligned}$$

and

$$\begin{aligned} \int_{-1}^1 x \sin n\pi x \, dx &= \left[\frac{-x \cos n\pi x}{n\pi} + \frac{1}{n\pi} \int \cos n\pi x \, dx \right]_{-1}^1 \\ &= \frac{-2 \cos n\pi x}{(n\pi)^2} \end{aligned}$$

Thus the second integral contributes to give

$$-\frac{8\cos n\pi x}{(n\pi)^2}$$

(iii)

$$\begin{aligned}\int_{-1}^1 x^4 \cos n\pi x \, dx &= \left[\frac{x^4 \sin n\pi x}{n\pi} - \frac{1}{n\pi} \int 4x^3 \sin n\pi x \, dx \right]_{-1}^1 \\ &= -\frac{4}{n\pi} \int_{-1}^1 x^3 \sin n\pi x \, dx\end{aligned}$$

and

$$\begin{aligned}\int_{-1}^1 x^3 \sin n\pi x \, dx &= \left[\frac{-x^3 \cos n\pi x}{n\pi} + \frac{1}{n\pi} \int 3x^2 \cos n\pi x \, dx \right]_{-1}^1 \\ &= \frac{-2 \cos n\pi}{n\pi} + \frac{3}{n\pi} \int_{-1}^1 x^2 \cos n\pi x \, dx\end{aligned}$$

Whence

$$\begin{aligned}\int_{-1}^1 x^4 \cos n\pi x \, dx &= \frac{8 \cos n\pi}{n\pi} - \frac{12}{(n\pi)^2} \int_{-1}^1 x^2 \cos n\pi x \, dx \\ &= \frac{8 \cos n\pi}{n\pi} - \frac{48 \cos n\pi}{(n\pi)^4}\end{aligned}$$

using (ii).

Finally,

$$\begin{aligned}a_n &= -\frac{48 \cos n\pi}{(n\pi)^4} \\ &= \frac{48(-1)^{n+1}}{(n\pi)^4}\end{aligned}$$

as $\cos n\pi x = (-1)^n$

Hence the Fourier Series is given by

$$\begin{aligned}f(x) &= \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos n\pi x \\ &= \frac{8}{15} + \frac{48}{\pi^4} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^4} \cos n\pi x\end{aligned}$$

$f(x)$ satisfies the Dirichlet conditions. The 1st derivative is the lowest derivative which is discontinuous (at the endpoints, as $f(x)$ even fn $\Rightarrow f'(x)$ odd), so Fourier coefficients are $\mathcal{O}(\frac{1}{n^2})$ as $n \rightarrow \infty$

QUESTION 2

Extending on range $(-\pi, \pi)$ so $L = \pi$ and

(a)

$$\frac{f(x_+) + f(x_-)}{2} = \sum_{n=1}^{\infty} b_n \sin nx$$

where

$$\begin{aligned} b_n &= \frac{2}{L} \int_0^L f(x) \sin \left(\frac{n\pi x}{L} \right) dx \\ &= \frac{2}{\pi} \int_0^{\pi} x^2 \sin nx \, dx \end{aligned}$$

Integrating by parts,

$$\begin{aligned} \int_0^{\pi} x^2 \sin nx \, dx &= \left[\frac{-x^2 \cos nx}{n} + \frac{1}{n} \int 2x \cos nx \, dx \right]_0^{\pi} \\ &= \frac{-\pi^2 \cos n\pi}{n} + \frac{2}{n} \int_0^{\pi} x \cos nx \, dx \end{aligned}$$

and once again,

$$\begin{aligned} \int_0^{\pi} x \cos nx \, dx &= \left[\frac{x \sin nx}{n} - \frac{1}{n} \int \sin nx \, dx \right]_0^{\pi} \\ &= -\frac{1}{n} \int_0^{\pi} \sin nx \, dx \\ &= -\frac{1}{n} \left[-\frac{\cos nx}{n} \right]_0^{\pi} \\ &= \frac{1}{n^2} (\cos n\pi - 1) \end{aligned}$$

Back substituting in,

$$\begin{aligned} b_n &= \frac{2}{\pi} \left(\frac{-\pi^2 \cos n\pi}{n} + \frac{2}{n^3} (\cos n\pi - 1) \right) \\ &= \frac{2}{\pi n^3} (-2 + (2 - (\pi n)^2) \cos n\pi) \end{aligned}$$

Hence Fourier sine series given by:

$$f(x) = \sum_{n=1}^{\infty} \frac{2}{\pi n^3} (-2 + (2 - (\pi n)^2)(-1)^n) \sin nx$$

(b) Similarly,

$$\frac{f(x_+) + f(x_-)}{2} = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx$$

where

$$\begin{aligned} \frac{a_0}{2} &= \frac{1}{L} \int_0^L f(x) \, dx \\ &= \frac{1}{\pi} \int_0^{\pi} x^2 \, dx \\ &= \frac{\pi^2}{3} \end{aligned}$$

and

$$\begin{aligned} a_n &= \frac{2}{L} \int_0^L f(x) \cos\left(\frac{n\pi x}{L}\right) \, dx \\ &= \frac{2}{\pi} \int_0^{\pi} x^2 \cos nx \, dx \end{aligned}$$

Integrating by parts,

$$\begin{aligned} \int_0^{\pi} x^2 \cos nx \, dx &= \left[\frac{x^2 \sin nx}{n} - \frac{1}{n} \int 2x \sin nx \, dx \right]_0^{\pi} \\ &= \frac{-2}{n} \int_0^{\pi} x \sin nx \, dx \end{aligned}$$

and once again,

$$\begin{aligned} \int_0^{\pi} x \sin nx \, dx &= \left[\frac{-x \cos nx}{n} + \frac{1}{n} \int \cos nx \, dx \right]_0^{\pi} \\ &= \frac{-\pi \cos n\pi}{n} + \frac{1}{n} \left[\frac{\sin nx}{n\pi} \right]_0^{\pi} \\ &= \frac{-\pi \cos n\pi}{n} \end{aligned}$$

Thus

$$a_n = \frac{4}{n^2} \cos n\pi$$

and the Fourier cosine series is given by

$$f(x) = \frac{\pi^2}{3} + \sum_{n=1}^{\infty} \frac{4}{n^2} (-1)^n \cos nx$$

Fourier series for $g(x) = 2x$ (odd function) in the range $(-\pi, \pi)$ given by

$$\frac{f(x_+) + f(x_-)}{2} = \sum_{n=1}^{\infty} b_n \sin nx$$

where

$$\begin{aligned} b_n &= \frac{1}{L} \int_{-L}^L f(x) \sin\left(\frac{n\pi x}{L}\right) dx \\ &= \frac{2}{\pi} \int_{-\pi}^{\pi} x \sin nx \, dx \end{aligned}$$

Integrating by parts,

$$\begin{aligned} \int_{-\pi}^{\pi} x \sin nx \, dx &= \left[\frac{-x \cos nx}{n} + \frac{1}{n} \int \cos nx \, dx \right]_{-\pi}^{\pi} \\ &= \frac{-2\pi \cos n\pi}{n} + \frac{1}{n} \left[\frac{\sin nx}{n\pi} \right]_{-\pi}^{\pi} \\ &= \frac{-2\pi(-1)^n}{n} \end{aligned}$$

Whence

$$g(x) = \sum_{n=1}^{\infty} \frac{4\pi^2(-1)^{n+1}}{n^2} \sin nx$$

Fourier series for $h(x) = 2|x|$ (even function) in the range $(-\pi, \pi)$ given by

$$\frac{f(x_+) + f(x_-)}{2} = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos nx$$

where

$$\begin{aligned} \frac{1}{2}a_0 &= \frac{1}{2L} \int_{-L}^L f(x) \, dx \\ &= \frac{1}{2\pi} \int_{-\pi}^{\pi} 2|x| \, dx \\ &= \frac{2}{\pi} \int_0^{\pi} x \, dx \\ &= \pi \end{aligned}$$

and

$$\begin{aligned} a_n &= \frac{1}{L} \int_{-L}^L f(x) \cos\left(\frac{n\pi x}{L}\right) \, dx \\ &= \frac{2}{\pi} \int_{-\pi}^{\pi} |x| \cos nx \, dx \end{aligned}$$

Integrating by parts,

$$\begin{aligned} \int_{-\pi}^{\pi} |x| \cos nx \, dx &= 2 \int_0^{\pi} x \cos nx \, dx \\ &= 2 \left[\frac{x \sin nx}{n} - \frac{1}{n} \int \sin nx \, dx \right]_0^{\pi} \\ &= -\frac{2}{n} \int_0^{\pi} \sin nx \, dx \\ &= -\frac{2}{n} \left[-\frac{\cos nx}{n} \right]_0^{\pi} \\ &= \frac{2}{n^2} (\cos n\pi - 1) \end{aligned}$$

Whence

$$h(x) = \pi + \sum_{n=1}^{\infty} \frac{2}{n^2} ((-1)^n - 1) \cos nx$$

QUESTION 3

$f(x) = e^x$ on $(-\pi, \pi)$ has Fourier series given by

$$\frac{f(x_+) + f(x_-)}{2} = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} [a_n \cos nx + b_n \sin nx]$$

where

$$\begin{aligned} \frac{1}{2}a_0 &= \frac{1}{2\pi} \int_{-\pi}^{\pi} e^x \, dx \\ &= \frac{1}{2\pi} (e^{\pi} - e^{-\pi}) \\ &= \frac{1}{\pi} \sinh \pi \end{aligned}$$

and

$$\begin{aligned} a_n &= \frac{1}{\pi} \underbrace{\int_{-\pi}^{\pi} e^x \cos nx \, dx}_{I_a} \\ I_a &= \left[e^x \cos nx + \int e^x n \sin nx \, dx \right]_{-\pi}^{\pi} \\ &= (e^{\pi} - e^{-\pi}) \cos n\pi + n \int_{-\pi}^{\pi} e^x \sin nx \, dx \\ &= 2 \sinh \pi (-1)^n + n \left[e^x \sin nx - \int e^x n \cos nx \, dx \right]_{-\pi}^{\pi} \\ &= 2 \sinh \pi (-1)^n - n^2 \int_{-\pi}^{\pi} e^x \cos nx \, dx \\ &= 2 \sinh \pi (-1)^n - n^2 I_a \end{aligned}$$

Hence

$$a_n = \frac{1}{\pi} I_a \quad I_a = \frac{2}{1 + n^2} \sinh \pi (-1)^n$$

Also,

$$\begin{aligned} b_n &= \frac{1}{\pi} \underbrace{\int_{-\pi}^{\pi} e^x \sin nx \, dx}_{I_b} \\ I_b &= \left[e^x \sin nx - \int e^x n \cos nx \, dx \right]_{-\pi}^{\pi} \\ &= -n I_a \end{aligned}$$

$$b_n = -\frac{n}{\pi} I_a$$

Combining these results, the Fourier series for e^x is given by

$$\begin{aligned} f(x) &= \frac{1}{\pi} \sinh \pi + \sum_{n=1}^{\infty} \left[\left(\frac{1}{\pi} \cos nx - \frac{n}{\pi} \sin nx \right) I_a \right] \\ &= \frac{1}{\pi} \sinh \pi + \frac{2}{\pi} \sinh \pi \sum_{n=1}^{\infty} \left[(\cos nx - n \sin nx) \frac{(-1)^n}{1+n^2} \right] \end{aligned}$$

Setting $x = \pi$ yields

$$e^{\pi} = \frac{1}{\pi} \sinh \pi + \frac{2}{\pi} \sinh \pi \sum_{n=1}^{\infty} \frac{1}{1+n^2}$$

Thus

$$\sum_{n=1}^{\infty} \frac{1}{1+n^2} = \frac{\pi e^{\pi} - \sinh \pi}{2 \sinh \pi}$$

Setting $x = -\pi$ similarly yields

$$\sum_{n=1}^{\infty} \frac{1}{1+n^2} = \frac{\pi e^{-\pi} - \sinh \pi}{2 \sinh \pi}$$

Adding and dividing by two,

$$\begin{aligned} \sum_{n=1}^{\infty} \frac{1}{1+n^2} &= \frac{\pi(e^{\pi} + e^{-\pi}) - 2 \sinh \pi}{4 \sinh \pi} \\ &= \frac{2\pi \cosh \pi - 2 \sinh \pi}{4 \sinh \pi} \\ &= \frac{1}{2}(\pi \coth \pi - 1) \end{aligned}$$

QUESTION 4

(i) Reposing the Fourier Series of $f(t)$ using complex variables,

$$\begin{aligned}
 f(t) &= \frac{a_0}{2} + \sum_{n=1}^{\infty} \left[\frac{a_n}{2} \left(e^{\frac{in\pi t}{L}} + e^{\frac{-in\pi t}{L}} \right) + \frac{b_n}{2i} \left(e^{\frac{in\pi t}{L}} - e^{\frac{-in\pi t}{L}} \right) \right] \\
 &= \sum_{n=-\infty}^{\infty} c_n e^{\frac{in\pi t}{L}}, \\
 c_n &= \frac{a_n - ib_n}{2} \quad n > 0; \\
 c_{-n} &= \frac{a_n + ib_n}{2} \quad n > 0; \\
 c_0 &= \frac{a_0}{2}
 \end{aligned}$$

Using the orthogonality of complex exponentials and the properties of complex Fourier coefficients, we deduce that

$$\begin{aligned}
 \int_{-L}^L [f(t)]^2 dt &= \sum_{n=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} c_n c_m \int_{-T}^T \exp \left[\frac{i\pi t(n+m)}{L} \right] dt \\
 &= \sum_{n=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} c_n c_m 2T \delta_{n[-m]} \\
 &= 2T \sum_{n=-\infty}^{\infty} c_n c_{-n} \\
 &= 2T \sum_{n=-\infty}^{\infty} c_n c_n^* \\
 &= 2T \sum_{n=-\infty}^{\infty} |c_n|^2
 \end{aligned}$$

This can be then re-expressed in terms of the a_n and b_n as

$$\int_{-L}^L [f(t)]^2 dt = L \left[\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \right]$$

as required.

(ii)

The unit amplitude square wave has Fourier series (odd function)

$$f(t) = \sum_{n=1}^{\infty} b_n \sin\left(\frac{n\pi t}{T}\right)$$

Frequencies less than $\frac{9}{2}\pi T^{-1}$ correspond to terms in the Fourier series with $\frac{n\pi}{T} < \frac{9}{2}\pi T^{-1}$, ie. $n = 1, 2, 3, 4$.

Also,

$$b_n = \frac{1}{T} \int_{-T}^T$$

=

QUESTION 5

$f(x)$ on $(0, 2\pi)$ has Fourier series given by

$$\frac{f(x_+) + f(x_-)}{2} = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} [a_n \cos nx + b_n \sin nx]$$

where

$$\begin{aligned} \frac{1}{2}a_0 &= \frac{1}{2\pi} \int_0^{2\pi} f(x) \, dx \\ &= \frac{1}{2\pi} \int_{\pi}^{2\pi} 1 \, dx \\ &= \frac{1}{2} \end{aligned}$$

and

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx \, dx \\ &= \frac{1}{\pi} \int_{\pi}^{2\pi} \cos nx \, dx \\ &= \frac{1}{\pi} \left[\frac{1}{n} \sin nx \right]_{\pi}^{2\pi} \\ &= 0 \end{aligned}$$

and

$$\begin{aligned}
b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx \, dx \\
&= \frac{1}{\pi} \int_{\pi}^{2\pi} \sin nx \, dx \\
&= \frac{1}{\pi} \left[-\frac{1}{n} \cos nx \right]_{\pi}^{2\pi} \\
&= -\frac{1}{\pi n} [\cos nx]_{\pi}^{2\pi} \\
&= 0 \text{ if } n \text{ even or } -\frac{2}{n\pi} \text{ if } n \text{ odd}
\end{aligned}$$

Hence

$$f(x) = \frac{1}{2} - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{\sin(2n-1)x}{2n-1}$$

(ii) Taking the hint, differentiating term by term gives

$$\frac{d}{dx}[S_n(x)] = \frac{2}{\pi} \sum_{n=1}^N \cos(2n-1)x$$

Now

$$\begin{aligned}
\sum_{n=1}^N \cos(2n-1)x &= \operatorname{Re} \left[\sum_{n=1}^N e^{(2n-1)i} \right] \\
&= \operatorname{Re} \left[\frac{e^{(2N+1)i} - e^i}{e^{2i} - 1} \right]
\end{aligned}$$

QUESTION 6

Assuming the solution takes the form $y \propto e^{\sigma x}$, we have

$$y(x) = A \cos(\mu x) + B \sin(\mu x)$$

where A and B are constants, and $\mu^2 = \lambda$. Applying the boundary conditions, $y(0) = 0$ implies that $A = 0$. The other boundary condition implies

$$B \sin \mu + B \mu \cos \mu = 0$$

$$\mu = -\tan \mu$$

This eigenvalue equation has an infinite number of solutions, μ_n (and hence there an infinite number of positive eigenvalues $\lambda_n = \mu_n^2$).

As $n \rightarrow \infty$, $\mu_n \rightarrow \infty$, so μ is close to an odd multiple of $\frac{\pi}{2}$, ie. $\mu_n \approx (2n+1)\pi/2$, and hence $\lambda_n \approx (2n+1)^2\pi^2/4$

QUESTION 7

- (i) $p(x) = \exp\left(\int^x \frac{-2u}{1-u^2} du\right) = (1-x^2)$, thus integrating factor is $-\frac{1}{1-x^2} ((1-x^2)) = -1$. We can then rewrite the equation as

$$-(1-x^2)y'' + 2xy' - n(n+1)y = 0$$

and

$$-\frac{d}{dx} \left((1-x^2) \frac{dy}{dx} \right) - n(n+1)y = 0$$

- (ii)

$$\begin{aligned} p(x) &= \exp\left(\int^x \frac{(1+a+b)u-c}{u(u-1)} du\right) \\ &= \exp\left(\int^x \frac{c}{u} + \frac{1+a+b-c}{u-1} du\right) \\ &= \exp(c \log x + (1+a+b-c) \log(x-1)) \\ &= x^c + (x-1)^{1+a+b-c} \end{aligned}$$

Thus the required integrating factor is

$$-\frac{x^c + (x-1)^{1+a+b-c}}{x(x-1)}$$

The equation becomes

$$-(x^c + (x-1)^{1+a+b-c})y'' - [(1+a+b)x-c] \frac{x^c + (x-1)^{1+a+b-c}}{x(x-1)} y' - \frac{x^c + (x-1)^{1+a+b-c}}{x(x-1)} aby = 0$$

which, in Sturm-Liouville form, is

$$-\frac{d}{dx} \left[(x^c + (x-1)^{1+a+b-c}) \frac{dy}{dx} \right] - \frac{x^c + (x-1)^{1+a+b-c}}{x(x-1)} aby = 0$$

- (iii) Self-adjoint form, integrating factor $-e^{4x}$,

$$-\frac{d}{dx} \left(e^{4x} \frac{dy}{dx} \right) - 4e^{4x} y = \lambda e^{4x} y$$

weight function is hence e^{4x} .

Easier to consider original equation; assuming the solution takes the form $y \propto e^{\sigma x}$, σ satisfies the auxillary equation

$$\sigma^2 + 4\sigma + 4 + \lambda = 0 \Rightarrow \sigma = -2 \pm i\sqrt{\lambda},$$

$$y(x) = Ae^{-2x} \cos(\mu x) + Be^{-2x} \sin(\mu x)$$

where A and B are constants, and $\mu^2 = \lambda$. Applying the boundary conditions, $y(0) = 0$ implies that $A = 0$. The other boundary condition implies

$$\begin{aligned} Be^{-2} \sin \mu &= 0 \\ \Rightarrow \mu &= n\pi \end{aligned}$$

Thus infinite positive eigenvalues $\lambda_n = n^2\pi^2$

The associated eigenvectors are thus proportional to $e^{-2x} \sin(n\pi x)$.

Eigenvectors associated with distinct eigenvalues are indeed orthogonal on the interval, if the weight function e^{4x} is correctly included in the inner product integral I_{mn} , ($m \neq n$) defined as

$$I_{mn} = \int_0^1 e^{4x} Y_n(x) Y_m(x) \, dx$$

where Y_n and Y_m are normalized eigenfunction with distinct eigenvalues $\lambda_n = n^2\pi^2$ and $\lambda_m = m^2\pi^2$

QUESTION 8

The Sturm-Louville problem

$$-\frac{d}{dx} \left(x \frac{du}{dx} \right) = \lambda x u, \quad 0 < x < 1$$

hence with weight function x , can be reposed in original form as

$$xu'' + u' + \lambda xu = 0$$

We try $u = \sum_{n=0}^{\infty} a_n x^n$, first writing the equation in equidimensional form by multiplying by x

$$(x^2 u'') + (xu') + \lambda x^2 u = 0$$

However we cannot find any series solutions about $x = 0$, as it is an irregular singular point.

QUESTION 9
